

[1]

Sustainable economic development requires availability of state of the art-infrastructure, transport and power availability.

To meet this ever-growing demand there is substantial increase in the number of automobiles and power plants. This growth has led to considerable degradation in the ambient air quality, because of the increase in greenhouse emissions. For sustainable habitation, achieving carbon neutral is key.

As a step towards this, the conference aims to explore newer clean energy and combustion technologies in energy and automobile systems.
